Problem: Maximum Planar Subset

Given is a set C of n chords of a circle (see Figure 1 (a)). We assume that no two chords of C share an endpoint. Number the endpoints of these chords from 0 to $2n - 1$, clockwise around the circle (see Figure 1 (c)). Let $M(i, j)$, $i \leq j$, denote the number of chords in the maximum *planar subset* (i.e., no two chords overlap each other in the subset) in the region formed by the chord \overline{ij} and the arc between the endpoints i and j (see Figure 1 (d)). As the example shown in Figure 1 (a), $M(2, 7) = 1$, $M(3, 3) = 0$, and $M(0, 11) = 3$. You are asked to write a program that computes the number of chords in the maximum planar subset in a circle of n chords, i.e., compute $M(0, 2n - 1)$, and reports the details of each chords, as shown in Figure 1 (b).

Figure 1: Maximum planar subset.

Input

The input consists of an integer $2n$, $1 \leq n \leq 90,000$, denoting the number of vertices on a circle, followed by n lines, each containing two integers a and b ($0 \leq a, b \leq 2n - 1$), denoting two endpoints of a chord. A single "0" (zero) in the input line signifies the end of input.

Output

The output file reports the number of chords in the maximum planar subset in the input circle of n chords, followed by a list of the two endpoints for each resulting chord in the maximum planar subset (sorted by the first endpoint in the increasing order).

Here is an input/output example (see Figure 1):

Sample Input	Sample Output
12	3
0 4	0 4
1 9	5 7
2 6	8 11
3 10	
5 7	
8 11	
0	

Required Files:

You need to submit the following materials in a *.tar.gz* or *.zip* file: (1) Source codes (*e.g.* `maxPlanarSubset.c`); (2) Executable binary; (3) A text readme file describing how to compile and run your programs.

The submission filename should be `<student_id>-<p2>.tar.gz` or `<student_id>-<p2>.zip` (*e.g.* `b03901000-p2.zip`). If you have a modified version, please add `-v[version_number]` as a postfix to the filename and resubmit it to the submission website (*e.g.* `b03901000-p2-v1.zip`, `b03901000-p2-v2.zip`, etc.).

Language/Platform:

1. Language: C, C++, or Java.
2. Platform: Unix/Linux or Windows

Evaluation:

The individual score per test case is determined by the correctness of the output result as well as the file format. Bonus will be given to most efficient programs. (Note that there are more hidden test cases to evaluate your program.)

For any questions, please email Zhi-Wen at lwz@eda.ee.ntu.edu.tw.
